F77 Program 14

```
c       Fortran 77 program to do a simulation of the Weibull distribution
c       of the simplest censoring model -
c                                          x = t if t < constant
c                                          x = constant if t >= constant
c       (Where constant = mean of something, etc)
c       This program may be adapted for censored models as well as the
c       simplest censoring model.
c       ************************************************************************
c               By Derek Dhammaloka FDX3 - 21st Jan. 1991
c       ************************************************************************
c               Define the following variables
c
c               cdf is the cumulative density function of the probability
c               function and is between 0 and 1. The function urand will
c               generate the random numbers between 0 and 1. It has 1
c               parameter iy, the seed to initialise the generator.
c               t is the remission time in arbitary units
c               sumln is the sum of the logs to the base e
c               sumpower is the sum of the powers
c               sumpowerln is the sum of product of (t**k) and ln t
c               spln2 is the same as sumpowerln, but has (ln pt)**2
c               kold is the old value of kappa in the iteration loop
c               knew is the new value of kappa to be entered by the
c               user, but is changed in the iteration loop until it is
c               almost equal to kold.
c               kdiff is the difference between the new and old
c               values of kappa
c               ipp,ipk and ikk are the elements of the info. matrix
c               rho is the rate to be entered by the user
c               tol is the tolerance value
c               loop is used in loop counters
c               n is the no. of individuals to be entered by the user
c               d is the no. of uncensored individuals
c               c is the constant censor time
c               const is the minimum time for censoring to occur. It is
c               to be entered by the user.
c               i is the indicator variable (1 if censored, 0 otherwise)
c               x is equal to t if t is less than C, C otherwise
c               swops is the no. of swops
c               sorts is the no. of sorts
c               temp is used in sorting data values
c               list assigns the values 1,n so that it can be used in
c               sorting 1 variable in ascending or descending order and
c               the other variables have the same values as the original
c               data, but is being sorted
c               psn is the no. of trials in view at a certain time
c               ple is the product limit estimator
c               prcensor is the probability of censoring
c               surf is the survivor function with its estimated
c               parameters, kappa and rho of the Weibull distribution
c               diff is the absolute difference between the product
c               limit estimator and the survivor function (does not have
c               to be declared as an array!)
c               maxdiff is the maximum of the absolute differences
```

```
c
c         cvald5 is the critical value of d at the 5% level
c         iy is the seed to be entered by the user.
c*************************************************************************
c         Estimate kappa and rho
c         Find the product limit estimator
c         Use the K-S test to examine the goodness of fit
